2 $6 + (3 + (-11)) > -2 + (4 + (-6))$

3

a Divide -6 by 2

b Multiply 3 and 4

4

a $-3 \times 4 - 2 = -14$

b $2 - (-3 \times 5) = 17$

c $-6 + 5 \times 2 = 4$

d $(-17 - 3) \div 5 = -4$

12

a True
Possible explanation:
Multiplying a negative by a positive number is like repeated addition of negative number for the given positive number of times therefore resulting a negative answer.

b False
Possible explanation:
The product of two negative numbers is always positive. An even number is always divisible by 2. The product of even negative numbers is a multiple of the positive product of two negative numbers which is always positive.

13 Negative
Possible explanation:
Division is the inverse of multiplication. Multiplying a positive and a negative number results in a negative product. A positive number divided by a negative number should give a negative quotient.
