

Angles of inclination

- 1 Find the slope of a line that is inclined at an angle of 50° to the positive x -axis. Round your answer to one decimal place.
- 2 Find the measure of the angle of inclination of a line to the positive x -axis, whose slope is 4. Round your answer to the nearest degree.
- 3 Consider the given line with an angle of inclination of θ with the positive x -axis:
 - a Find the slope of the line.
 - b Now, find the measure of θ . Round your answer to two decimal places.

- 4 In the following graph, point $P(15, 7)$ lies on the line passing through the origin. Find the measure of θ , the angle of inclination of the line with the positive x -axis. Round your answer to two decimal places.

- 5 In the following graph, point $P(5.2, 5.72)$ lies on the line passing through the origin. Find the measure of θ , the angle of inclination of the line with the positive x -axis. Round your answer to two decimal places.

- 6 Consider the graph of the line $y = \frac{1}{2}x + 1$ given and the triangle whose vertices are the origin, the x -intercept and the y -intercept. θ is the acute angle in the triangle that the line makes with the x -axis.

- State the slope of the line.
- Find the value of $\tan \theta$.

- 7 Consider the following graph: Find the measure of θ , the angle of inclination of the line with the positive x -axis, if the x -intercept is -5 and the y -intercept is 9 . Round your answer to two decimal places.

b $5x + 6y - 2 = 0$
