

Power Series and Taylor Series

ANSWER KEY

Radius and interval of convergence

- Find the radius of convergence of $\sum_{n=1}^{\infty} \frac{x^n}{n}$.
Ratio test: $\left| \frac{x^{n+1}/(n+1)}{x^n/n} \right| \rightarrow |x|$. Converges for $|x| < 1$: radius of convergence $R = 1$.
- Find the radius of convergence of $\sum_{n=0}^{\infty} \frac{x^n}{n!}$.
Ratio test: $\left| \frac{x^{n+1}/(n+1)!}{x^n/n!} \right| = \frac{|x|}{n+1} \rightarrow 0$ for every x : radius of convergence $R = \infty$.

Taylor and Maclaurin series

- Find the first three nonzero terms of the Maclaurin series for $f(x) = e^x$, using $f^{(n)}(0) = 1$ for all n .
 $e^x = 1 + x + \frac{x^2}{2!} + \dots = 1 + x + \frac{x^2}{2} + \dots$
- Find the third-degree Taylor polynomial for $f(x) = \cos x$ centered at $x = 0$.
 $f(0) = 1, f'(0) = 0, f''(0) = -1, f'''(0) = 0$: $T_3(x) = 1 - \frac{x^2}{2}$.
- Use the Maclaurin series $\sin x = x - \frac{x^3}{6} + \frac{x^5}{120} - \dots$ to approximate $\sin(0.2)$ using the first two nonzero terms, to four decimal places.
 $0.2 - \frac{(0.2)^3}{6} = 0.2 - 0.001333\dots \approx 0.1987$.

Interval of convergence (including endpoints)

- Find the interval of convergence of $\sum_{n=1}^{\infty} \frac{(x-2)^n}{n}$, checking both endpoints.
Ratio test gives radius $R = 1$, centered at $x = 2$: $1 < x < 3$ tentatively. At $x = 3$: $\sum \frac{1}{n}$ diverges (harmonic).
At $x = 1$: $\sum \frac{(-1)^n}{n}$ converges (alternating). Interval of convergence: $[1, 3)$.
- Find the radius of convergence of $\sum_{n=1}^{\infty} n! x^n$.
Ratio test: $\left| \frac{(n+1)! x^{n+1}}{n! x^n} \right| = (n+1)|x| \rightarrow \infty$ for any $x \neq 0$. The series converges only at $x = 0$: radius of convergence $R = 0$.

Using known series

- Using the known Maclaurin series $e^x = \sum_{n=0}^{\infty} \frac{x^n}{n!}$, write the Maclaurin series for e^{-x^2} (substitute $-x^2$ for x), giving the first three terms.
 $e^{-x^2} = 1 + (-x^2) + \frac{(-x^2)^2}{2!} + \dots = 1 - x^2 + \frac{x^4}{2} - \dots$
- Using $\frac{1}{1-x} = \sum_{n=0}^{\infty} x^n$ for $|x| < 1$, write the power series for $\frac{1}{1+x^2}$ (substitute $-x^2$ for x).
 $\frac{1}{1+x^2} = \frac{1}{1-(-x^2)} = \sum_{n=0}^{\infty} (-x^2)^n = \sum_{n=0}^{\infty} (-1)^n x^{2n} = 1 - x^2 + x^4 - x^6 + \dots$

Taylor series centered at a nonzero point

- 10** Find the first three terms of the Taylor series for $f(x) = \ln x$ centered at $x = 1$, using $f(1) = 0$, $f'(1) = 1$, $f''(1) = -1$.
- $$T(x) = f(1) + f'(1)(x - 1) + \frac{f''(1)}{2!}(x - 1)^2 + \cdots = (x - 1) - \frac{(x - 1)^2}{2} + \cdots$$
- 11** Find the second-degree Taylor polynomial for $f(x) = \sqrt{x}$ centered at $x = 4$, given $f(4) = 2$, $f'(4) = \frac{1}{4}$, $f''(4) = -\frac{1}{32}$.
- $$T_2(x) = 2 + \frac{1}{4}(x - 4) - \frac{1}{64}(x - 4)^2$$
-

Error estimation with Taylor polynomials

- 12** Using the second-degree Maclaurin polynomial for $\cos x$, $T_2(x) = 1 - \frac{x^2}{2}$, estimate $\cos(0.3)$ to four decimal places, and compare to the true value $\cos(0.3) \approx 0.9553$.
- $$T_2(0.3) = 1 - \frac{0.09}{2} = 1 - 0.045 = 0.9550, \text{ very close to the true value } 0.9553 \text{ (error } \approx 0.0003).$$
-

Visualizing a Taylor approximation

- 13** The graph compares $f(x) = \cos x$ to its second-degree Maclaurin polynomial $T_2(x) = 1 - \frac{x^2}{2}$. Use the graph to describe where the approximation is best and where it breaks down.
- The two curves are nearly indistinguishable near $x = 0$, where the approximation is best (the region of the expansion point). As $|x|$ increases toward $\pm\pi$, $T_2(x)$ (a downward parabola) diverges sharply from the bounded, oscillating $\cos x$, showing the approximation breaks down away from the center.
-

Differentiating and integrating power series

- 14** Given $\frac{1}{1-x} = \sum_{n=0}^{\infty} x^n$ for $|x| < 1$, differentiate both sides term-by-term to find a power series for $\frac{1}{(1-x)^2}$.
- $$\frac{d}{dx} \left[\frac{1}{1-x} \right] = \frac{1}{(1-x)^2}. \text{ Differentiating the series: } \sum_{n=1}^{\infty} nx^{n-1}. \text{ So } \frac{1}{(1-x)^2} = \sum_{n=1}^{\infty} nx^{n-1} = 1 + 2x + 3x^2 + \cdots$$
- 15** Using the Maclaurin series $\sin x = \sum_{n=0}^{\infty} \frac{(-1)^n x^{2n+1}}{(2n+1)!}$, integrate term-by-term to find the first three terms of the power series for $\int \sin x \, dx = -\cos x + C$, and confirm they match the known Maclaurin series for $-\cos x$.
- $$\int \left(x - \frac{x^3}{6} + \cdots \right) dx = \frac{x^2}{2} - \frac{x^4}{24} + \cdots + C. \text{ Comparing to } -\cos x = -1 + \frac{x^2}{2} - \frac{x^4}{24} + \cdots: \text{ matching term-by-term (aside from the constant } -1, \text{ absorbed into } C) \text{ confirms consistency.}$$
-

Using Taylor series to evaluate a limit

- 16** Use the Maclaurin series $\sin x = x - \frac{x^3}{6} + \dots$ to evaluate $\lim_{x \rightarrow 0} \frac{\sin x - x}{x^3}$.
 $\sin x - x = -\frac{x^3}{6} + \frac{x^5}{120} - \dots$, so $\frac{\sin x - x}{x^3} = -\frac{1}{6} + \frac{x^2}{120} - \dots \rightarrow -\frac{1}{6}$ as $x \rightarrow 0$.
- 17** Find the fourth-degree Taylor polynomial for $f(x) = e^x$ centered at $x = 0$, and use it to estimate $e^{0.5}$, comparing to the true value $e^{0.5} \approx 1.6487$.
 $T_4(x) = 1 + x + \frac{x^2}{2} + \frac{x^3}{6} + \frac{x^4}{24}$. $T_4(0.5) = 1 + 0.5 + 0.125 + 0.02083 + 0.0026 \approx 1.6484$, very close to the true value 1.6487.
- 18** An engineer needs a quick approximation for $\ln(1.1)$ without a calculator. Using the Maclaurin series $\ln(1+x) = x - \frac{x^2}{2} + \frac{x^3}{3} - \dots$ for $|x| < 1$, find the approximation using the first three terms with $x = 0.1$, and compare to the true value $\ln(1.1) \approx 0.09531$.
 $\ln(1.1) \approx 0.1 - \frac{(0.1)^2}{2} + \frac{(0.1)^3}{3} = 0.1 - 0.005 + 0.000333 \approx 0.095333$, extremely close to the true value 0.09531 (error ≈ 0.00002).
