

Precalculus Review for Calculus

Functions and composition

- 1 Let $f(x) = \sqrt{x-1}$ and $g(x) = x^2 + 3$. Find:
 - a $(f \circ g)(x)$
 - b $(g \circ f)(x)$
 - c the domain of $f \circ g$
 - 2 Simplify the difference quotient $\frac{f(x+h) - f(x)}{h}$ for $f(x) = x^2 - 3x$.
-

Lines, exponentials, and trig — the toolkit calculus builds on

- 3 Find the slope and equation of the line through $(-1, 4)$ and $(3, -2)$.
 - 4 Solve $2e^{3x} = 14$ exactly and to three decimal places.
 - 5 State the exact value of each expression, needed frequently when differentiating trig functions:
 - a $\sin \frac{\pi}{4}$
 - b $\cos \frac{\pi}{3}$
 - c $\tan \frac{\pi}{6}$
-

Factoring and rational expressions

- 6 Factor each expression fully:
 - a $x^2 - 5x + 6$
 - b $4x^2 - 9$
 - c $x^3 - 8$
 - 7 Simplify $\frac{x^2 - 4}{x^2 - x - 6}$, stating the value(s) of x excluded from the domain.
-

Inverse functions and logarithms

- 8 Find the inverse of $f(x) = 3x - 5$, and verify by computing $f(f^{-1}(x))$.
 - 9 Solve $\ln(x - 1) = 2$ exactly and to three decimal places.
-

Piecewise and absolute value review

- 10 Sketch-reasoning: rewrite $f(x) = |2x - 6|$ as a piecewise function without absolute value bars.
- 11 Solve the inequality $|3x + 1| \leq 7$, writing your answer in interval notation.
-

Systems of equations

- 12 Solve the system $2x + y = 7$ and $x - y = 2$ by elimination.
- 13 Find the point(s) of intersection of $y = x^2$ and $y = 2x + 3$.
