Voronoi diagrams

1

a All the points in cell A are closer to site A than the other sites.

b These points are equidistant between site A and site B.

c This is the only point that is equidistant to all three sites.

2

a Site A because the point lies in cell A.

b No solution provided.

c

i Site B **ii** Site A **iii** Site C **iv** Site B

3

a No solution provided.

b No solution provided.

c No solution provided.

d No solution provided.

e No, because there is no point that intersects with all the edges that divide the four cells.

Applications

4

a School D

b

i School A **ii** $2.86\ \mathrm{km}$

c

i Either school C or D. **ii** School A

5 Example answer:
The point $(10, 50)$ would be a good location is it is quite far from most of the towns and is on the ege between Town E and J, so it will be equidistant from both towns so not too close to either town.
